

What matters is the global and local pitch direction

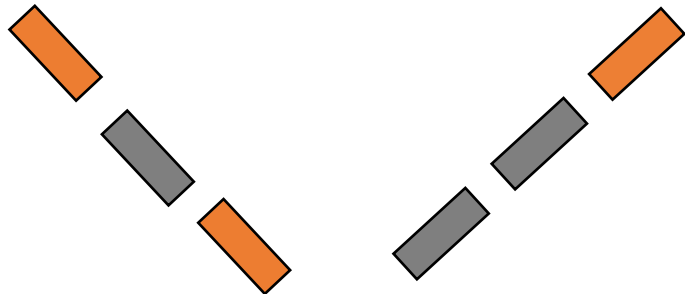

You need to ignore transpositions (shifts in overall pitch).

These two melodies have the same global and local pitch patterns, even though the second is higher in pitch.

These two melodies are the same at the global level but differ at the local level, even though the second is lower in pitch.

Occasionally, the sweeps will change in timbre (they will sound different, as if they came from a different source).

You need to ignore differences in timbre (in this example, orange indicates a different timbre).

Here → Global: different | Local: different
